Yamaha Motor Manufacturing Corporation of America  
Newnan, GA

**Re: Electrical Design Engineer (Job Code: 9816337)**

I came across the Electrical Design Engineer position at YMMC and it maps directly to the work I've been doing across my projects and internship. Electrical systems design, 3D CAD, PCB troubleshooting, and control system validation are all things I have hands-on experience in. I'm graduating from Fordham University in May 2026 with a B.S. in Engineering Physics (Electrical Concentration).

My most relevant project is a 12-sensor automotive data acquisition system I designed and built for vehicle use. It integrates sensors across CAN bus, I2C, and UART with real-time sampling and automated logging, and I validated the system over 50+ hours of field testing with less than 2% measurement error. That project required exactly the skills this role describes: working with vehicle electrical systems, debugging sensor and harness issues with diagnostic equipment, and iterating on the design until it worked reliably. I also designed a flight controller with a power distribution system, including schematic creation, component selection, and a control system with cascaded PID loops; that project took me through the full design cycle from concept to working hardware, including prototyping and problem-solving when things didn't perform as intended.

At Hyzon Motors I supported high-voltage system validation on a 400–800V DC bus, performing insulation resistance, hipot, and continuity testing on electrical harnesses and documenting results against design specifications. I work in Fusion 360 and SolidWorks for 3D CAD, have done PCB assembly and rework at the SMD level across 50+ client engagements as a freelance electronics technician, and I'm proficient in Python and MATLAB for data analysis. My coursework covers electromagnetics, circuits, and control systems directly.

I'm ready to relocate to Newnan and available to start after graduating in May. The chance to develop electrical systems for Yamaha vehicles from prototype through production is exactly the kind of role I'm looking for. Thanks for considering my application.

Sincerely,  
Zeke Mohammed
